Plansee Liezen produces tantalum, tantalum-tungsten and niobium. These are either used directly by our customers in the form of wire, rods, sheets and tubes or are further processed at our other sites to produce complex components.

With its many years of experience in the field of tantalum sintering, Plansee Liezen is continuously optimizing its manufacturing processes.

With the new machining capabilities it possesses for the manufacture of complex finished parts, Plansee Liezen acts as a long-term competence center for tantalum and niobium.
We specialize in:

- Sintered wires made from pure tantalum and tantalum-tungsten alloys
- Sintered tantalum wires for the capacitor industry
- Grain-stabilized tantalum
- Seamless tubes made from pure tantalum, tantalum-tungsten and niobium
- Heat spreaders
